Institutional Shareholder Services (ISS), Shearman & Sterling LLP and the European Corporate Governance Institute (ECGI) submitted the results of a Study on proportionality between ownership and control in EU listed companies to European Commission.

After nine months of research, the facts and figures on proportionality between ownership and control were submitted to the European Commission by ISS and its partners Shearman & Sterling and the ECGI.

Last year, the European Commission commissioned a research report to understand an important corporate governance issue: the proportionality between ownership and control. This study is part of the Commission’s efforts to base any policy initiatives it might wish to take in this area on objective data. As Charlie McCreevy, European Commissioner for Internal Market and Services, said at the time of the launching of the initiative “The study represents the essential starting point for any further discussion on the adequacy of control to capital. It will provide a full, systematic picture of the essential features of Corporate Europe that the European public opinion is waiting for. Any discussion about how to move on, about possible initiatives in this area, needs to be based on sound facts.”

Those facts are now on the table. Some highlights of the Study, which covers nineteen countries, are:

- All countries allow Control Enhancing Mechanisms (“CEMs”) from a legal point of view.
- A wide variety of protective mechanisms are available to shareholders in companies featuring CEMs.
- Not all companies use CEMs, even though they might be available. 44% of companies in the sample feature one of more CEM.
- The review of academic research shows that there is no theoretical or empirical basis for encouraging or discouraging CEMs in general at this stage. Regulation must take into account the specific circumstances in which a CEM is or might be used.
- The countries with the highest proportion of companies featuring at least one CEM are France, Sweden, Spain, Hungary and Belgium, which all have a majority of companies featuring CEMs.
- Recently listed companies have fewer CEMs than large companies. This means fewer occurrences of CEMs but also fewer combinations of CEMs.
- Investors say they mostly perceive Control Enhancing Mechanisms negatively. According to most investors, this influences investment decisions. 80% of investors in the sample expect a discount ranging from 10% to 30% of market price.
“For ISS, this Study will have been a success if it contributes to shedding more light on the subject of proportionality and to fostering more transparency in the market place, for the benefits of listed companies as well as shareholders,” said Jean-Nicolas Caprasse, Managing Director of ISS Europe. “I’m convinced this objective has been achieved.”

“This is the first time a study surveys the potential availability of Control Enhancing Mechanisms and protective legal devices in nineteen jurisdictions. It shows that a broad range of mechanisms is available in most countries, even when they have different legal traditions”, said Christophe Clerc, European Counsel at Shearman & Sterling. “All countries apply the freedom of contract principle to varying degrees.”

Marco Becht, Executive Director of the ECGI said: “The ECGI is very pleased that independent research is having such a significant influence on the governance debate. This study shows CEMs are complex and deserve serious reflection. It is the first step towards systematic stocktaking and evaluation of the proportionality between ownership and control in EU listed companies, based on European data and realities.”
